

# AnyDate

## The System i Date Simulator

**A**nyDate™, the complete date simulator for your Power Systems™ running IBM i, is a time machine for your system. With AnyDate, you can simulate any date and time between the years 1928 and 2071, allowing you to run date- or time-sensitive applications without resetting your system date. And, because your date and time overrides are restricted to the job that initiates AnyDate, it is safe to use when other jobs are running on the System i.®

### AnyDate Lets You Control System i Time

#### Jump Into The Future

Want to see the effect when System i applications run in the future? AnyDate is the perfect way to test them. Use it any-time you need to simulate a future date and time.

#### Return To The Past

Sometimes you need to rerun historical reports that use the system date as a parameter. For example, if last weekend's production jobs failed, you can use AnyDate to restart them with the appropriate date value.

#### Stop The Clock

Use AnyDate when you need to freeze the system date or time in a job stream as part of your procedure testing.

#### Cross Time Zones

If your System i is part of a network of systems spread across different time zones, you can use AnyDate to show the correct time and date at each location.

### AnyDate Is Easy To Install And Use

AnyDate installs in minutes and is easy to start from both interactive and batch jobs. You control it by using two basic commands:

#### **OVRSYSDATE** (*Override System Date*)

Starts the job with the simulated values you specify.

#### **DLTDATEOVR** (*Delete Date Override*)

Ends the date simulation and returns the job to normal system values.

You simply enter the OVRSYSDATE command at a command line to run applications with a simulated date. Or, you can schedule AnyDate using a batch job scheduler, such as Robot/SCHEDULE, or run it in a CL procedure. Just use OVRSYSDATE as the first command in your job definition and DLTDATEOVR as the last command. To show you how easy it is to use, AnyDate is shipped with several test programs.

### AnyDate Lets You Pick The Date

See how easy it is to run your System i jobs anytime in the past, present, or future with AnyDate.
