

ESEND

E-Mail And FTP Distribution For The System i

ESEND™ delivers reports and files from your Power Systems™ running IBM i in the fastest, most cost-effective, and most reliable way possible: through e-mail, FTP, or the Web. ESEND's automated electronic distribution capabilities eliminate the need to print, burst, and mail hardcopy reports, and help you reduce or eliminate labor, paper, and shipping costs throughout your report distribution cycle. You get up-to-date information faster, and quicker access to the most current business information.

ESEND offers output queue forwarding and a spooled file manager to simplify report distribution. Plus, you can define custom settings for specific job requirements. ESEND provides a green screen interface and a graphical plug-in for the System i® Navigator. Both interfaces offer intuitive, easy-to-use menu options.

Comprehensive E-Mail And FTP Delivery Options

ESEND converts System i spooled files into PDF, HTML, RTF, and other PC file formats for distribution or archiving. It works with your existing form overlays, so you can incorporate form graphics within PDF file output. You can distribute converted files automatically as e-mail attachments or send them using FTP. You also can use FTP to transmit System i physical and spooled files to another server. (Physical files are sent in binary mode to preserve packed data.)

Customize Your E-Mail Messages And Attachments

ESEND gives you the flexibility to compose messages and attachments according to your requirements. You can include up to 300 attachments per message, with a maximum message size of 16 MB. Or, you can embed attachments within the message body of the e-mail, including the date sent and up to 6 lines of signature text.

Manage Distribution Effectively With Address Books And Lists

Define distribution address books and lists to manage and control your e-mail and FTP delivery. You can mix FTP and e-mail addresses for a single recipient or in a directory list, to send a file from one location to multiple locations and e-mail recipients in one operation. You also can use FTP Server Profiles to maintain address information for remote locations and to encrypt remote passwords.

Control Distribution With Bursting And Collating

ESEND lets you define comprehensive bursting rules to divide spooled file output for multiple recipients. Automated bursting and collating functions eliminate or reduce manual report distribution costs and hassles. And, each recipient gets only the reports or files they're supposed to see.

Automate The Entire Process With Output Queue Forwarding

ESEND monitors designated output queues and automatically e-mails spooled files that meet your criteria. ESEND converts spooled files to the desired format and uses bursting and collating rules to e-mail the files to the appropriate recipients.

Faster, Easier, And Less Expensive Report Distribution

Enjoy a fast return on investment (ROI) while you improve, streamline, and automate your report distribution with ESEND.
